

AI-Assisted Analysis: Python vs BigQuery ML

Factor	Python Model	BigQuery ML
Training Time	Medium (manual coding + execution)	Fast (cloud-based training)
Ease of Use	Requires programming knowledge	Very easy (SQL based)
Accuracy	Good accuracy	Similar good accuracy

Training Time: Python takes moderate time due to manual coding, whereas BigQuery ML trains faster using cloud infrastructure.

Ease of Use: Python requires coding knowledge, while BigQuery ML is easier as it uses simple SQL queries.

Accuracy: Both Python and BigQuery ML provide similar accuracy for simple forecasting problems.

Conclusion: BigQuery ML is faster and easier to use, while Python provides more flexibility. Both models give similar accuracy.
